

Glossary:

ADS-B: A satellite-based surveillance system used in modern aviation to track aircraft, which works automatically, while not using ground radar.

AIS: The maritime counterpart for the ADS-B, used for vessels over a certain size.

Transponder: A transmitter-responder device that replies to incoming signals with identifying data.

Track: The history of an aircraft or vessel position drawn into a path.

Anomaly: A deviation from expected behavior based on track history, declared intents, or expected paths.
